

Radial temperature through the hottest cell

heat-generating core
solid, $k = 40 \text{ W m}^{-1}\text{K}^{-1}$

aluminium housing wall
solid, $k = 167 \text{ W m}^{-1}\text{K}^{-1}$

cooling air annulus
 $k = 0.026 \text{ W m}^{-1}\text{K}^{-1}$

cooling air, first 12 mm off the housing surface
all four airspeeds

305 W, 10 m/s; each marker is one cell, radius axis broken at the two material interfaces.
